## LSM TEA Full

This is a Python-based software to conduct techno-economic assessments (TEA) for newly developed technologies, with a primary emphasis on projects with higher technology readiness level (TRL). The software has a user-friendly graphical interface and a complete set of utensils to conduct a comprehensive TEA. The featured canvas structure allows users to define the project by designing and customizing a process flow diagram. TEA reports are generated as Excel spreadsheets based on the data input from users through the interface.
